Touring Models

PROTECTING YOUR HARLEY SOFTAIL ENGINE MEANS KEEPING OIL TEMPERATURES COOL.

Protecting Your Harley Softail Engine Means Keeping Oil Temperatures Cool

The Oilbud™ keeps oil temps cooler and is virtually undetectable

(HELENA, Mont.) – March 5, 2008 --The days of sacrificing sleek lines and design style in the name of keeping oil temps cooler are gone. The new Oilbud™ intercooler efficiently delivers a 35 degree cooling differential, but what's better, the under mount design means no one knows the Oilbud™ is onboard.

Perhaps the reluctance to bolt the traditional radiator style oil cooler to the downtube of the frame has left some Harley owners in denial about the importance of oil temperature. Bud Clarke, owner of Oilbud™, wasn't content to let oil temps on his 2005 Softail run at 250 degrees and risk engine trouble.

One day when walking by an experimental airplane he was building at his business Air-Ryder, a thought struck Clarke. If the oil cooler he designed for his turbo charged, intercooled airplane could cool oil temps from 260 degrees to under 200, certainly he could design something for his Softail.

And he did.

Inspired by aircraft technology, the Oilbud™ is built from aircraft quality materials, polished stainless steel tubing, braided stainless hoses and 6061-T6 aluminum extrusion and welded in header tank assembly. The temperature regulator starts to open when oil temps hit 185 degrees and fully opens at 205 degrees. Temperature differentials from the cold to the hot side of the cooler have been measured up to 35 degrees.

The durable Oilbud™ fits between the frame rails, and once mounted under the motorcycle, it is virtually undetectable. It is designed for 2000-2008 Softails. It is easily installed with no major retrofits required

Cooler oil temperatures means longer engine life. What are the costs when oil gets too hot and breaks down? With Oilbud™, Softail owners no longer have to take the chance of running hot oil temps.
